

## **IN THE CLAIMS**

Please amend the claims (~~striketrough~~ and double brackets ([[ ]]) indicating deletion and underline indicating insertion) as follows:

1. (Currently Amended) A method for searching for a folder comprising:  
sending, from a remote server to a wireless device, a command file comprising instructions to assign command functions to controls on the wireless device, the wireless device enacting the command file and assigning the command functions to the ~~controls~~ buttons on the wireless device, the command functions being customized to a display and a control capacity of the wireless device;  
receiving, at the remote server, one or more initial search parameters from the wireless device, the one or more initial parameters different from a menu navigation command of the wireless device;  
activating a script in the remote server in response to the receipt of the one or more initial search parameters, wherein activating includes sending one or more queries to the wireless device;  
receiving a further search parameter from the wireless device in response to the one or more queries;  
identifying a folder based on the one or more initial search parameters and the further search parameter obtained responsive to the one or more queries, wherein the identified folder is part of a preexisting deck maintained by said remote server; and  
communicating the identified folder to said wireless device for performing a menu navigation to the identified folder[.]],  
wherein one of the remote server and the wireless device monitors the actions performed on the wireless device by identifying the folder being viewed from the menu as well as a selected item from the folder, and the remote server performs services based on the monitored actions.

2. (Previously Presented) The method of claim 1, wherein the script is associated with a navigation command, each of the one or more queries associated with the one or more initial search parameters.

3. (Canceled)

4. (Previously Presented) The method of claim 2, wherein the script further includes one or more operations that performs one of facilitating a purchase based on the one or more queries, facilitating a reservation based on the query and placing a phone call based on the query.

5. (Currently Amended) A method for searching for a folder or an item comprising:

sending, from a remote server to a wireless device, a command file comprising instructions to assign command functions to controls on the wireless device, the wireless device enacting the command file and assigning the command functions to the ~~controls~~ buttons on the wireless device, the command functions being customized to a display and a control capacity of the wireless device;

receiving, at the remote server, one or more initial search parameters from the wireless device, the one or more initial parameters different from a menu navigation command of the wireless device;

activating a script in the remote server in response to the receipt of the one or more initial search parameters, wherein activating the script includes sending one or more queries to the wireless device;

receiving a further search parameter from the wireless device in response to the one or more queries;

identifying a selection of a plurality of folders and/or a plurality of items based on the one or more initial search parameters and the further search parameter, each of the plurality of folders and items being part of a preexisting deck maintained by said remote server; and communicating a second menu to the wireless device based on the identified selection operation[[]],

wherein one of the remote server and the wireless device monitors the actions performed on the wireless device by identifying the plurality of folders being viewed from the menu as well as a selected item from the plurality of folders, and the remote server performs services based on the monitored actions.

6. (Previously Presented) The method of claim 5, wherein the second menu is a flat menu that includes two or more identified items.

7. (Previously Presented) The method of claim 6, wherein the second menu includes at least one text message that contains at least one of the one or more initial search parameters.

8. (Previously Presented) The method of claim 6, wherein the script is associated with a navigation command, each of the one or more queries associated with the one or more initial search parameters.

9. (Previously Presented) The method of claim 5, wherein the second menu is a hierarchical menu that includes two or more identified folders.

10. (Currently Amended) A remote server for searching a database for a folder or item to send to a wireless device, comprising:

a controller configured to send a command file comprising instructions to assign command functions to ~~controls~~ buttons on the wireless device, the wireless device enacting the

command file and assigning the command functions to the controls on the wireless device, the command functions being customized to a display and a control capacity of the wireless device;

an interface configured to receive one or more initial search parameters from the wireless device, the one or more initial search parameters different from a menu navigation command of the wireless device;

a script processor configured to activate a script in response to the receipt of the initial search parameters;

the script processor further configured to send one or more queries required by the script to wireless device via the interface;

the interface further configured to receive from the wireless device a further search parameter responsive to the one or more queries;

a search engine that performs a search operation of the database based on the one or more initial search parameters and the further search parameter, the search operation identifying at least one folder and/or at least one item, the at least one folder and at least one item each being part of a preexisting deck maintained by the database; and

a managing device that provides information to the wireless device based on the search operation, wherein the information provided includes one of the at least one identified folder and/or the at least one identified item or a portion of a second menu provided for display on the wireless device[.].

wherein one of the remote server and the wireless device monitors the actions performed on the wireless device by identifying the at least one folder being viewed from the menu as well as a selected item from the at least one folder, and the remote server performs services based on the monitored actions.

11. (Currently Amended) The remote server device of claim 10, wherein the information provided to the wireless device includes the at least one identified folder and/or the at least one identified item.

12. (Currently Amended) The remote server device of claim 10, wherein the information provided to the wireless device displays a portion of the second menu.

13. (Currently Amended) The remote server device of claim 12, wherein the second menu is a flat menu that includes two or more identified items.

14. (Currently Amended) The remote server device of claim 12, wherein the second menu is a hierarchical menu that includes two or more identified folders.

15. (Currently Amended) The remote server device of claim 12, wherein the second menu includes at least one text message that contains at least one of the one or more initial search parameters.

16. (Canceled)

17. (Currently Amended) [[A]] The remote server device of claim 10, wherein the script processor accesses information relating to an external network in response to the script.

18. (Currently Amended) A method for a remote server to provide information folders to a wireless device, comprising:

    sending a command file comprising instructions to assign command functions to controls on the wireless device, the wireless device enacting the command file and assigning the command functions to the controls buttons on the wireless device, the command functions being customized to a display and a control capacity of the wireless device;

    receiving a request from the wireless device for a folder, the folder containing items, wherein items include files, links and subordinate folders;

if the request includes a navigational command, then executing the navigational command to identify the folder;

if the request includes a search parameter and the search parameter is associated with a script, then activating the script;

if the script was activated and the script specifies a query, then sending the query to the wireless device;

if the query was sent to the wireless device, then receiving any additional search parameter from the wireless device responsive to the query;

if the request includes the search parameter, then searching a database for items based on the search parameter and any additional search parameter;

if the database was searched, then selecting the folder based on items found in searching the database; and

sending the selected folder to the wireless device[.],

wherein one of the remote server and the wireless device monitors the actions performed on the wireless device by identifying the folder being viewed from a menu as well as a selected item from the folder, and the remote server performs services based on the monitored actions.

19. (Previously Presented) The method of Claim 1, wherein selecting a folder further comprises selecting a folder found in searching the database that contains all other items found in searching the database.

20. (Previously Presented) The method of Claim 1, wherein selecting a folder further comprises creating a folder to contain all items found in searching the database and selecting the created folder.

21. (Previously Presented) The method of Claim 1, wherein selecting a folder further comprises selecting a folder found in searching the database that contains a plurality of items found in searching the database.

22. (Previously Presented) The method of Claim 1, wherein selecting a folder further comprises creating a folder to contain a plurality of items found in searching the database and selecting the created folder.

23. (Previously Presented) The method of Claim 1, wherein the queries sent to the wireless device are text or voice messages that include a request for a user of the wireless device to enter a keyword selected by the user in response to the query.
